### Concurrent programming

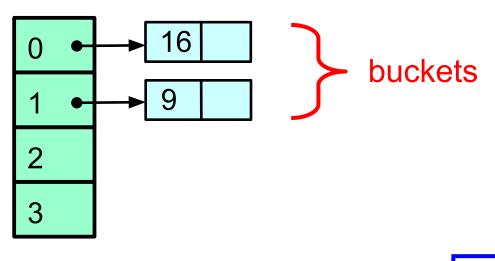

#### Hashing

Companion slides for

The Art of Multiprocessor Programming by Maurice Herlihy, Nir Shavit, Victor Luchangco, and Michael Spear

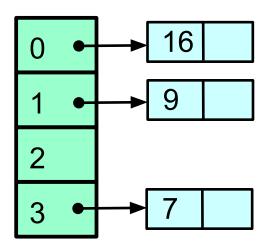

Modified by Piotr Witkowski

### Sequential Closed Hash Map

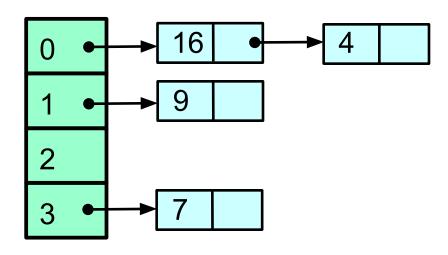

$$h(k) = k \mod 4$$

#### Add an Item

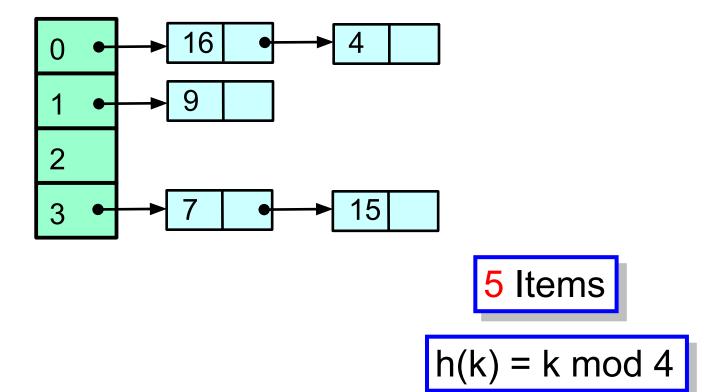

$$h(k) = k \mod 4$$

#### Add Another: Collision

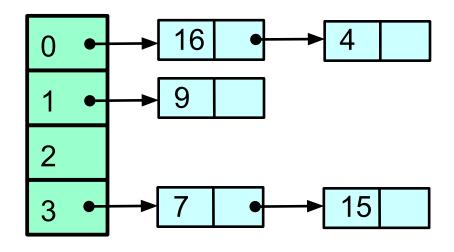

$$h(k) = k \mod 4$$

#### More Collisions

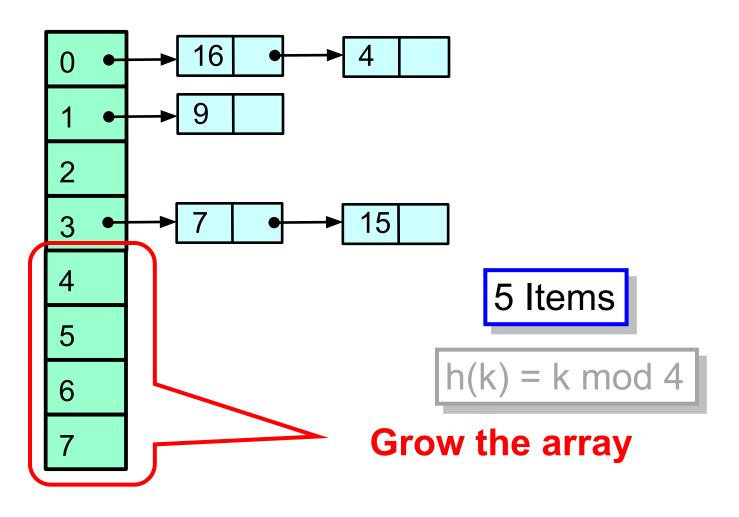

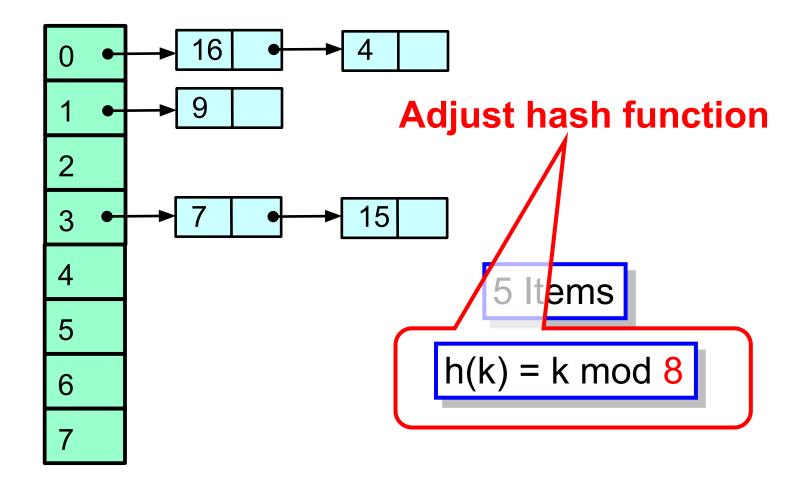

#### More Collisions

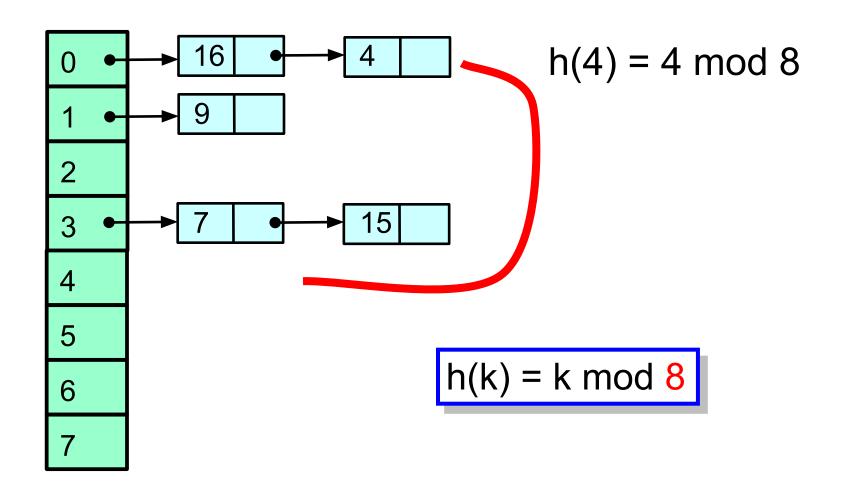

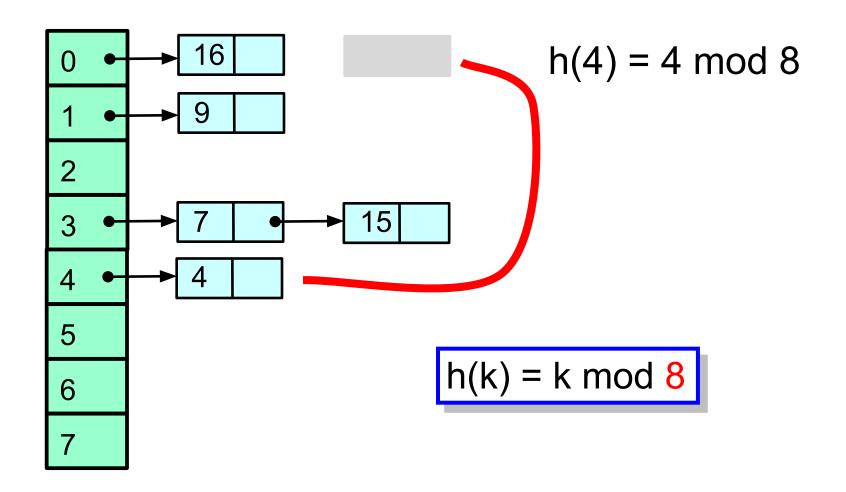

Problem: buckets becoming too long

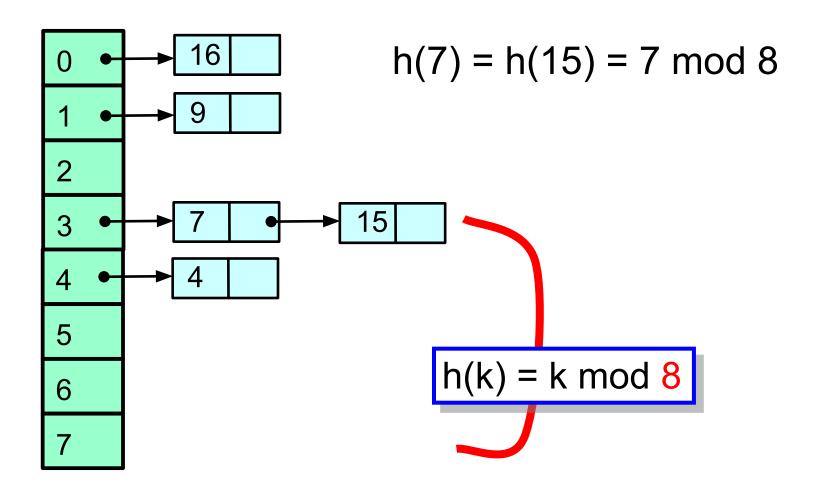

$$h(k) = k \mod 4$$

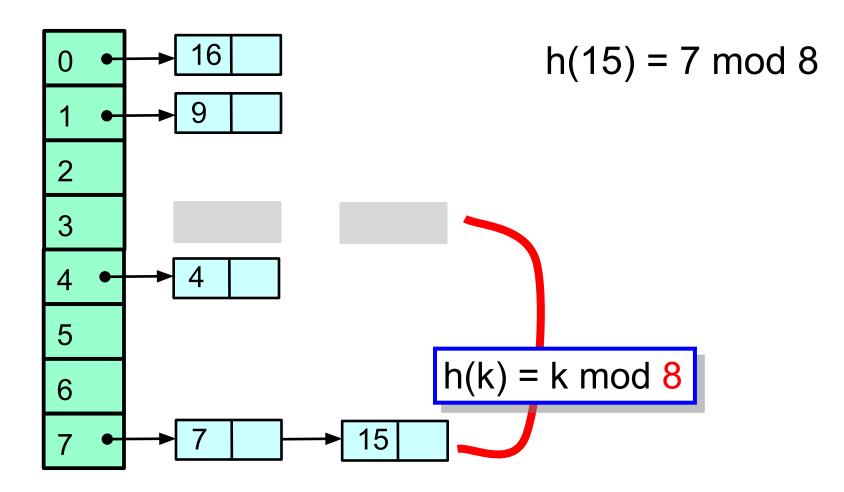

#### **Fields**

```
public class SimpleHashSet {
  protected LockFreeList[] table;

public SimpleHashSet(int tapacity) {
   table = new LockFreeList[capacity];
   for (int i = 0; i < capacity; i++)
      table[i] = new LockFreeList();
}

Array of lock-free lists</pre>
```

#### Constructor

```
public class SimpleHashSet {
   protected LockFreeList[] table;

public SimpleHashSet(int capacity) {
   table = new LockFreeList[capacity];
   for (int i = 0; i < capacity; i++)
     table[i] = new LockFreeList();
}
...
Initial size</pre>
```

#### Constructor

```
public class SimpleHashSet {
  protected LockFreeList[] table;
  public SimpleHashSet(int capacity)
    table = new LockFreeList[capacity];
                 0; i < dapacity, i+
      table[i] = new LockFreeL
                  Allocate memory
```

#### Constructor

```
public class SimpleHashSet {
  protected LockFreeList[] table;

public SimpleHashSet(int capacity) {
    table = new LockFreeList[capacity];
    for (int i = 0; i < capacity; i++)
        table[i] = new LockFreeList();
}
...</pre>
```

#### Initialization

#### Add Method

```
public boolean add(Object key) {
  int hash =
   key.hashCode() % table.length;
  return table[hash].add(key);
}
```

#### Add Method

```
int hash =
  key.hashCode() % table.length;
return table[hash].add(key);
}
Use object hash code to
```

pick a bucket

#### Add Method

```
public boolean add(Object key) {
  int hash =
    key.hashCode() % table.length;
  return table[hash].add(key);
}
```

Call bucket's add() method

#### No Brainer?

- We just saw a
  - Simple
  - Lock-free
  - Concurrent hash-based set implementation
- What's not to like?

#### No Brainer?

- We just saw a
  - Simple
  - Lock-free
  - Concurrent hash-based set implementation
- What's not to like?
- We don't know how to resize ...

### Is Resizing Necessary?

- Constant-time method calls require
  - Constant-length buckets
  - Table size proportional to set size
  - As set grows, must be able to resize

#### Set Method Mix

- Typical load
  - 90% contains()
  - **9%** add ()
  - 1% remove()
- Growing is important
- Shrinking not so much

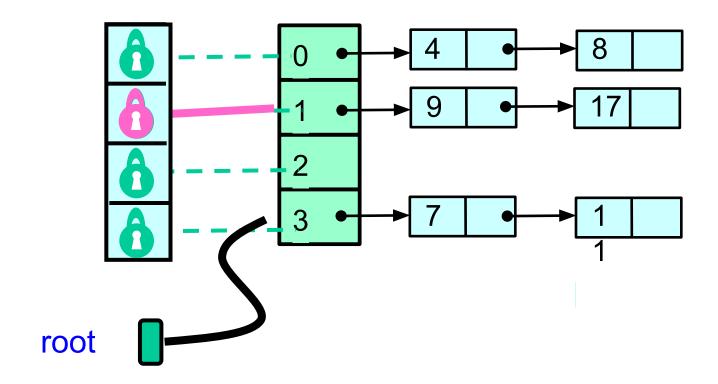

#### When to Resize?

- Many reasonable policies. Here's one.
- Pick a threshold on num of items in a bucket
- Global threshold
  - When ≥ ¼ buckets exceed this value
- Bucket threshold
  - When any bucket exceeds this value

### Coarse-Grained Locking

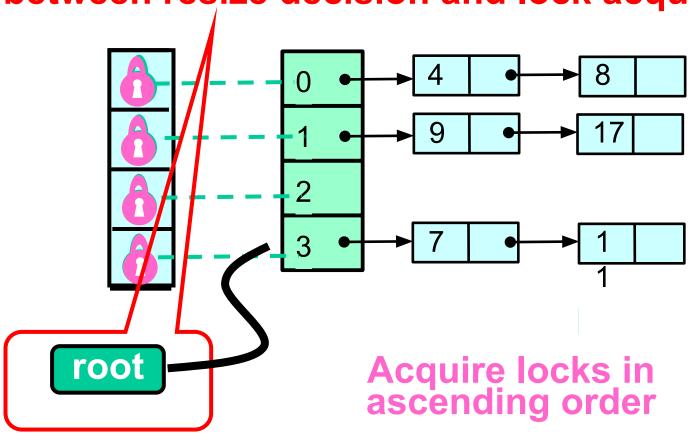

- Good parts
  - Simple
  - Hard to mess up
- Bad parts
  - Sequential bottleneck

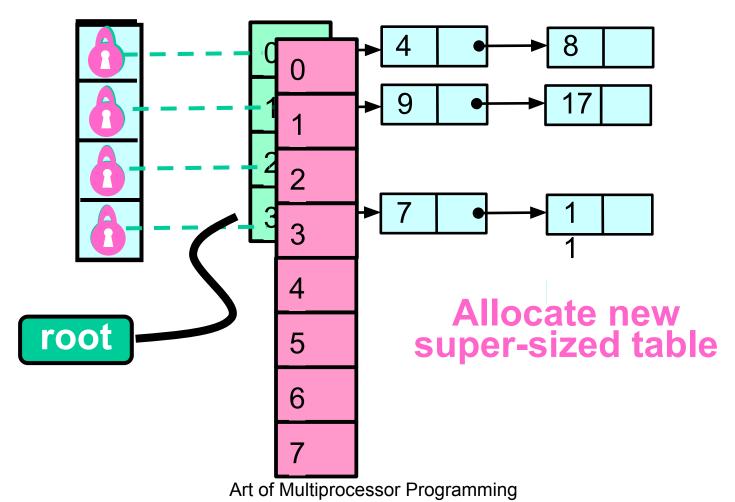

## Fine-grained Locking

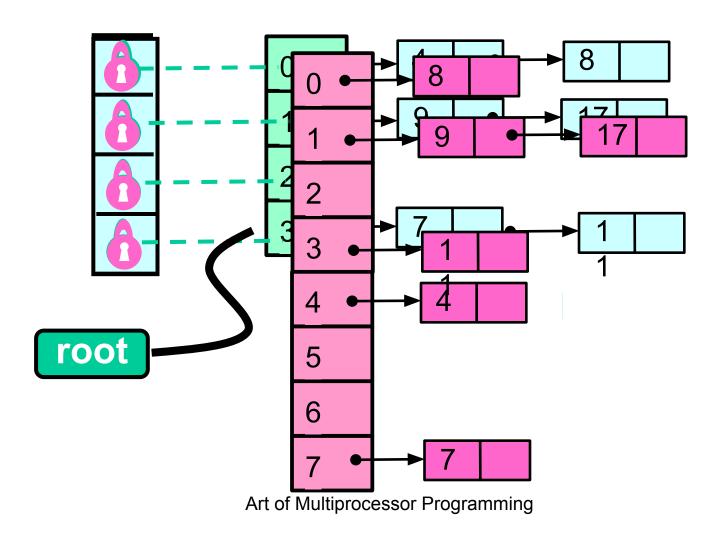

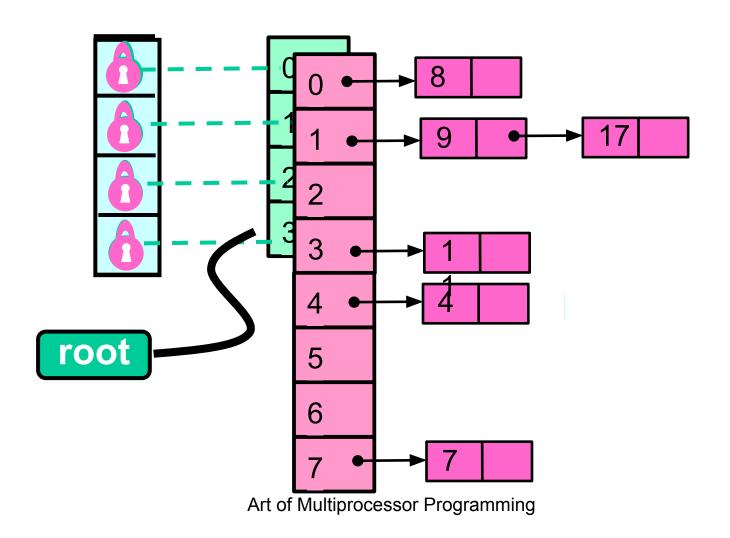

#### Each lock associated with one bucket

# Make sure root reference didn't change between resize decision and lock acquisition

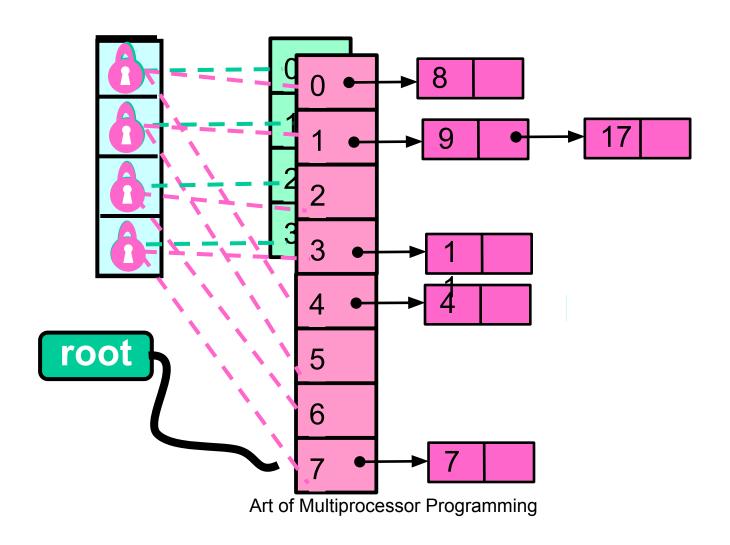

#### Striped Locks: each lock now associated with two buckets

#### Observations

- We grow the table, but not locks
  - Resizing lock array is tricky ...
- We use sequential lists
  - Not LockFreeList lists
  - If we're locking anyway, why pay?

```
public class FGHashSet {
protected RangeLock[] lock;
protected List[] table;
 public FGHashSet(int capacity) {
  table = new List[capacity];
  lock = new RangeLock[capacity];
  for (int i = 0; i < capacity; i++) {
   lock[i] = new RangeLock();
   table[i] = new LinkedList();
  }} ...
```

```
public class FGHashSet
protected RangeLock[] lock;
protected List[] table;
public FGHashSet(int capacity) {
 table = new List[capacity];
 lock = new RangeLock[capacity];
 for (int i = 0; i < capacity; i++) {
  lock[i] = new RangeLock();
  table[i] = new LinkedList();
                   Array of locks
 }} ...
```

```
public class FGHashSet {
 protected RangeLock[] lock;
protected List[] table;
 public FGHashSet(int capacity) {
  table = new List[capacity];
  lock = new Rangelock [capacity];
  for (int i = 0; i < capacity; i++) {
   lock[i] = new Rangelock();
   table[i] = new LinkedNist();
                  Array of buckets
  }} ...
```

```
public class Initially same number of
protected Range locks and buckets
 protected List[
public FGHashSet(int capa
  table = new List[capacity];
  lock = new RangeLock[dapacity]
 for (int i = 0; i < capacity; i++)
   lock[i] = new RangeLock();
   table[i] = new LinkedList();
```

#### The add() method

### Fine-Grained Locking

## The add() method

```
public boolean add(Object key) {
  int keyHash
  = key.hashCode() % lock.length;
  synchronized (lock[keyHash]) {
   int tabHash = key.hashCode() %
        table length;
   return table[tabHash].add(key);
  }
}
Acquire the lock
```

### Fine-Grained Locking

```
public boolean add(Object key) {
 int keyHash
  = key.hashCode() % lock.length;
 synchronized (lock[keyHash]) {
  int tabHash = key.hashCode()
                   table.length;
    turn table [tabHash] . add (key
```

#### Which bucket?

## The add() method

```
private void resize (int depth,
                     List[] oldTab) {
 synchronized (lock[depth]) {
  if (oldTab == table) {
   int next = depth + 1;
   if (next < lock.length)</pre>
    resize (next, oldTab);
   else
    sequentialResize();
 }}}
```

#### Fine-Grained Locking

```
private void resize(int depth,
                    List[] oldTab) {
 synchronized (lock[depth])
  if (oldTab == table) {
   int next = depth + 1;
   if (next < lock.length)
    resize (next, oldTab)
   else
        resize() calls resize(0,table)
```

```
private void resize (int depth,
                     List[] oldTab) {
synchronized (lock[depth]) {
   int next = depth + 1;
   if (next < lock.length
    resize (next, oldTal
   else
               Acquire next lock
    seque
 } } }
```

```
private void resize (int depth,
                     List[] oldTab) {
 synchronized (lock[depth]) {
  if (oldTab == table) {
   if (next < look.length)</pre>
    resize (next,
   else
  Check that no one else has resized
```

```
Recursively acquire next lock
synchronized (lock[depth]) {
 if (oldTab == table)
  int next = depth + 1;
  if (next < lock.length)</pre>
   resize (next, oldTab);
   sequentialResize();
} } }
```

```
Locks acquired, do the work
synchronized (lock[depth]) {
 if (oldTab == table) {
  int next = depth + 1;
 if (next < lock length)
   resize (next, dldTab);
  else
   sequentialResize()
```

#### **Another Locking Structure**

- add, remove, contains
  - Lock table in shared mode
- resize
  - Locks table in exclusive mode

#### Read-Write Locks

```
public interface ReadWriteLock {
   Lock readLock();
   Lock writeLock();
}
```

#### Read/Write Locks

```
Lock readLock();
Lock writeLock();
}
```

Returns associated read lock

#### Read/Write Locks

```
Returns associated read lock

Lock readLock();

Lock writeLock();
```

# Returns associated write lock

### Lock Safety Properties

- Read lock:
  - Locks out writers
  - Allows concurrent readers
- Write lock
  - Locks out writers
  - Locks out readers

# Lets Try to Design a Read-Write Lock

- Read lock:
  - Locks out writers
  - Allows concurrent readers
- Write lock
  - Locks out writers
  - Locks out readers

#### Read/Write Lock

- Safety
  - If readers > 0 then writer == false
  - If writer == true then readers == 0
- Liveness?
  - Will a continual stream of readers ...
  - Lock out writers?

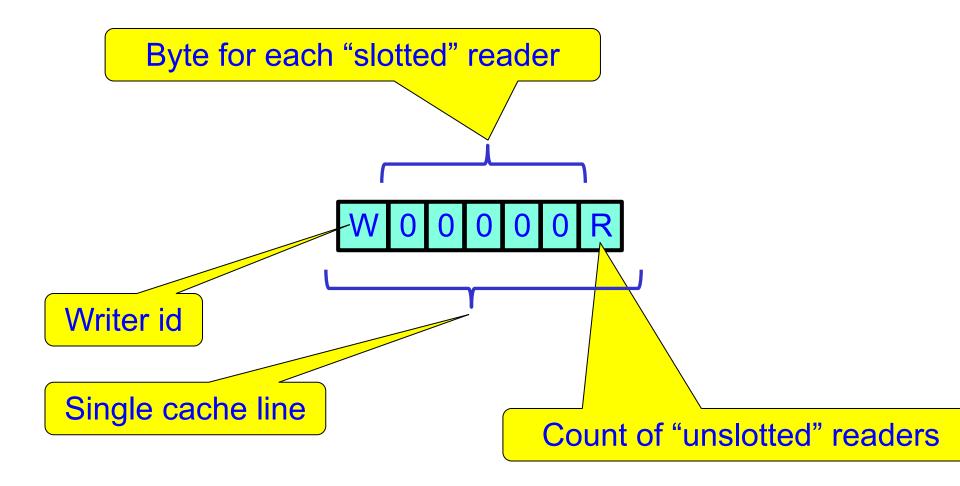

#### FIFO R/W Lock

- As soon as a writer requests a lock
- No more readers accepted
- Current readers "drain" from lock
- Writer gets in

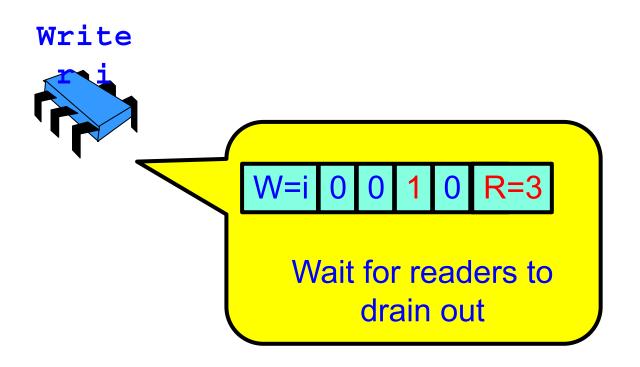

#### ByteLock

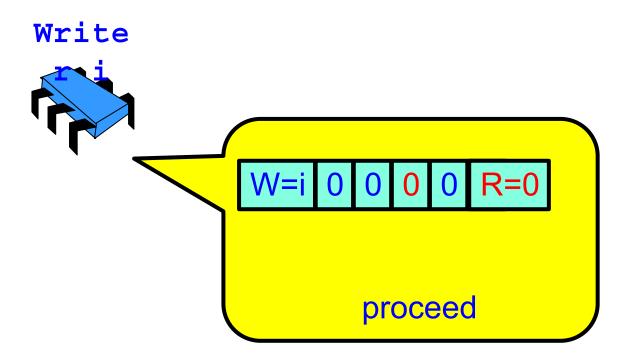

- Readers-Writers lock
- Cache-aware
- Fast path for "slotted readers"
- Slower path for others

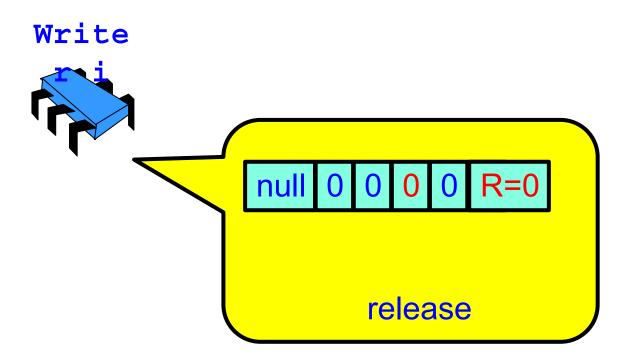

#### ByteLock Lock Record

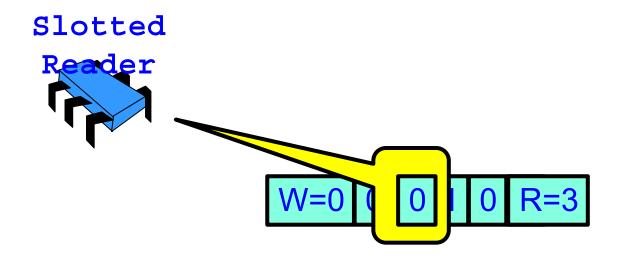

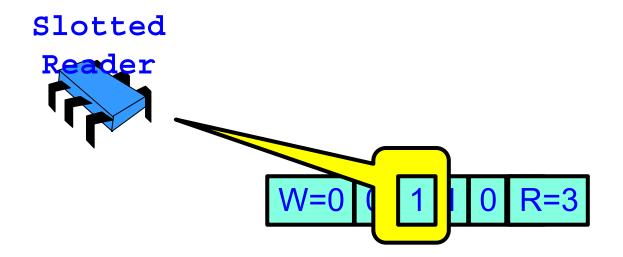

# Write W=0 1010R=3 CAS

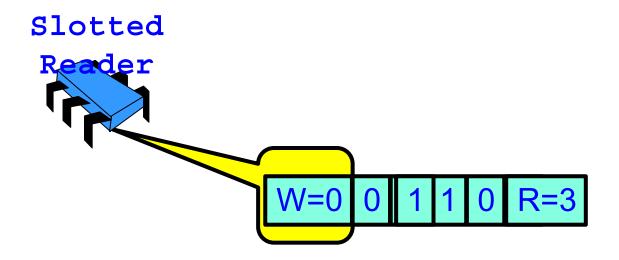

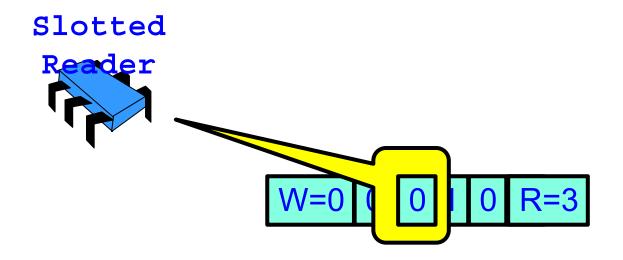

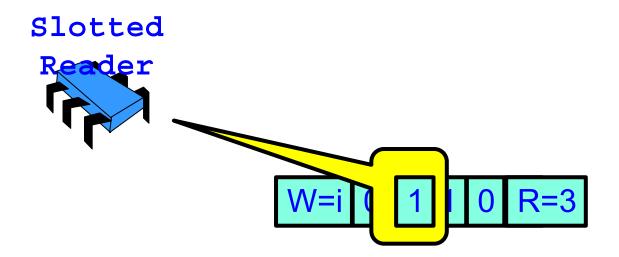

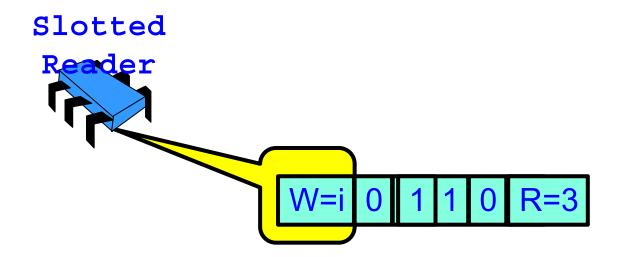

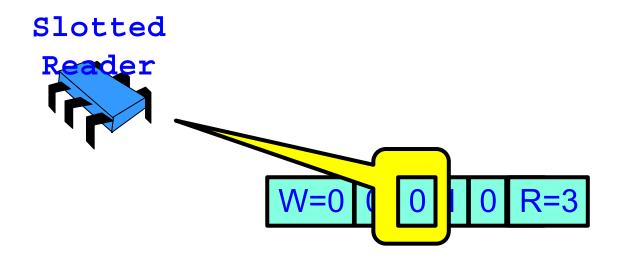

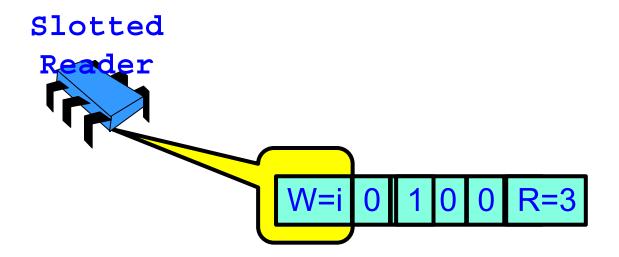

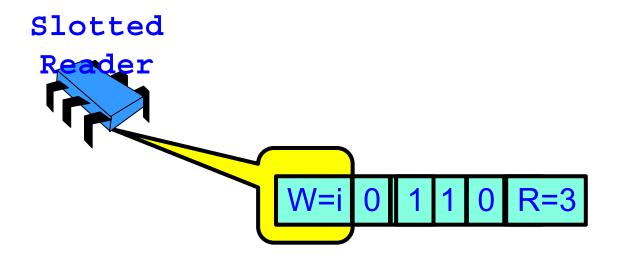

#### **Unslotted Reader**

#### UnslottedRead

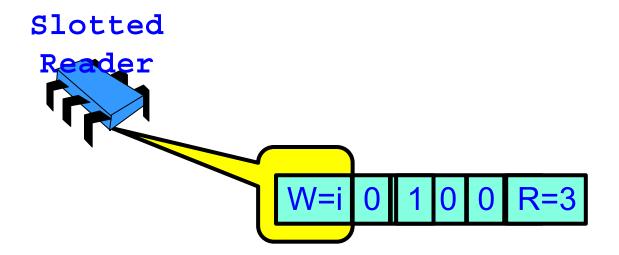

#### **Unslotted Reader**

#### UnslottedRead

#### Slotted Reader Slow Path

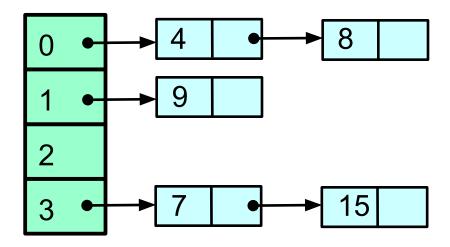

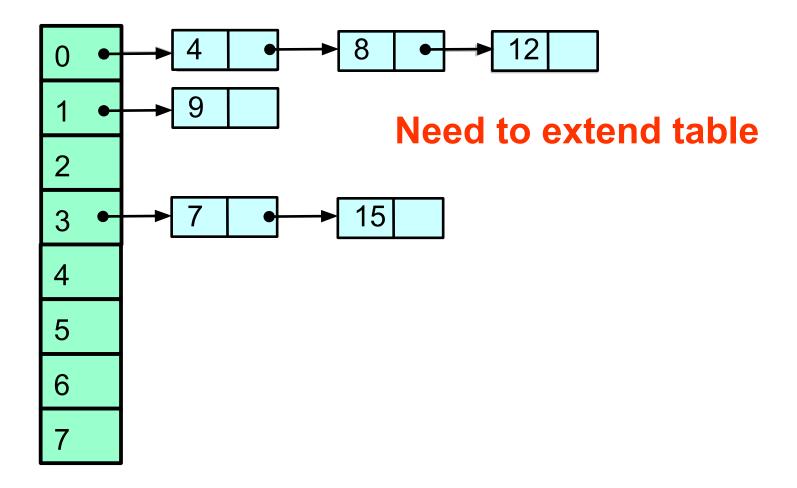

## The Story So Far

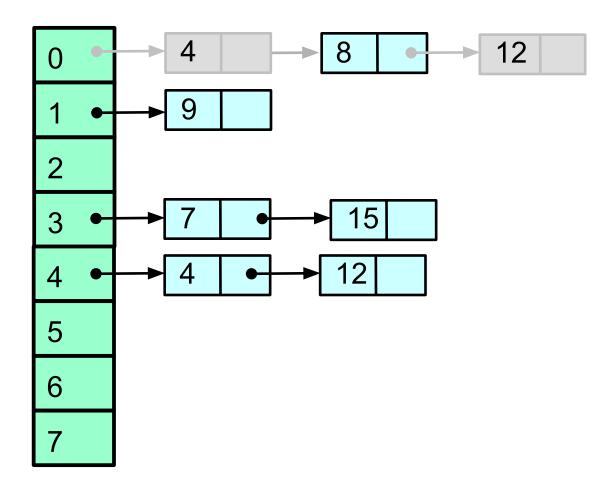

- Resizing is the hard part
- Fine-grained locks
  - Striped locks cover a range (not resized)
- Read/Write locks
  - FIFO property tricky

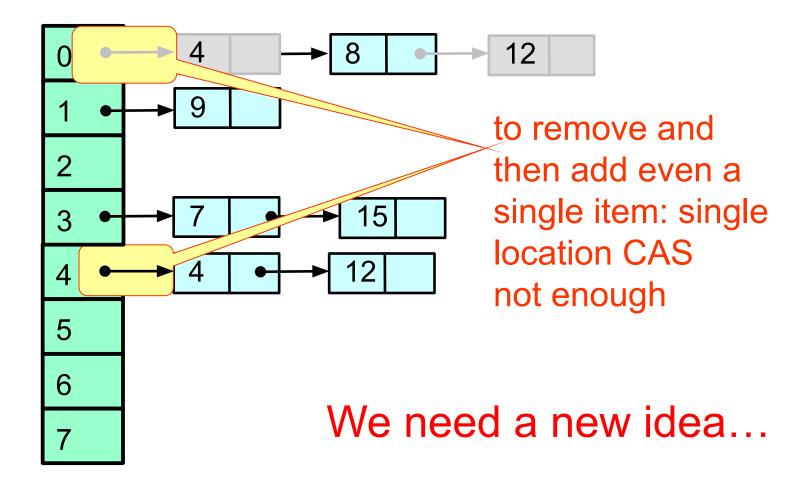

### Stop The World Resizing

- Resizing stops all concurrent operations
- What about an incremental resize?
- Must avoid locking the table
- A lock-free table + incremental resizing?

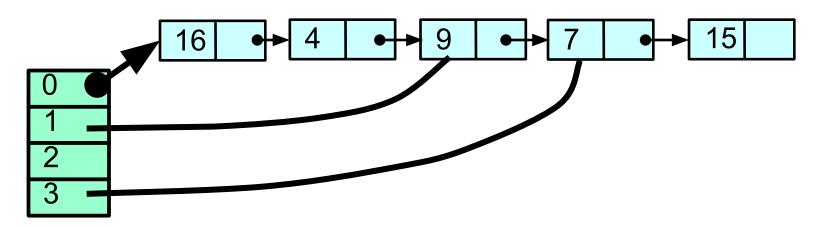

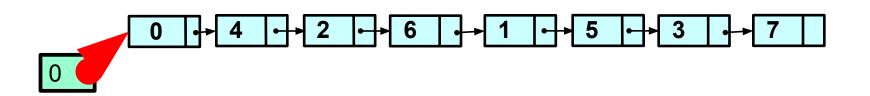

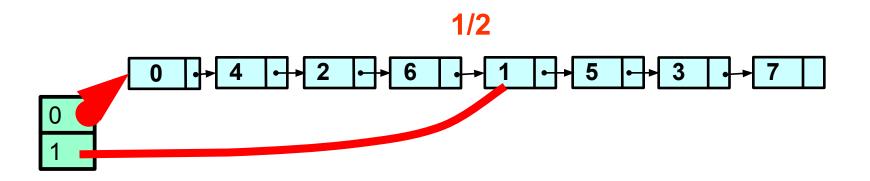

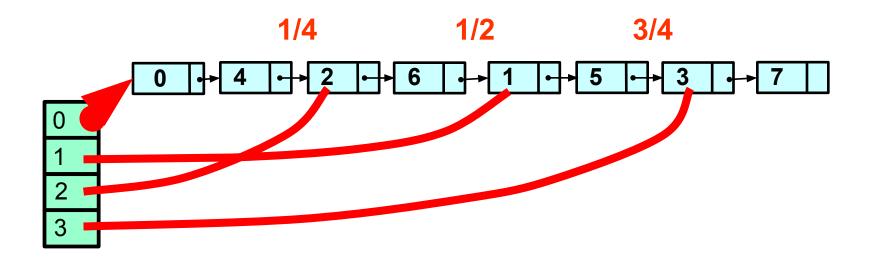

#### Don't move the items

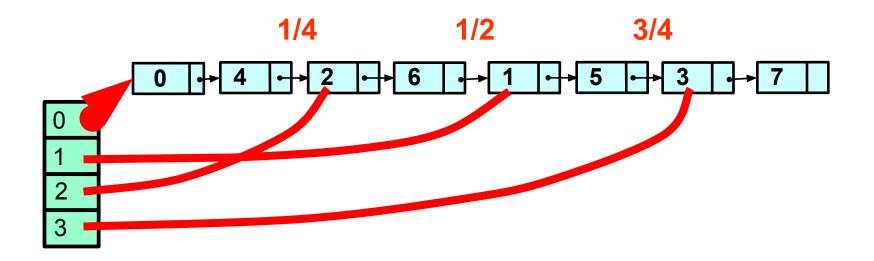

- Move the buckets instead!
- Keep all items in a single, lock-free list
- Buckets are short-cuts into the list

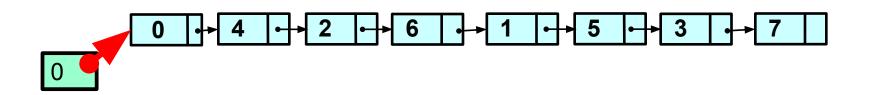

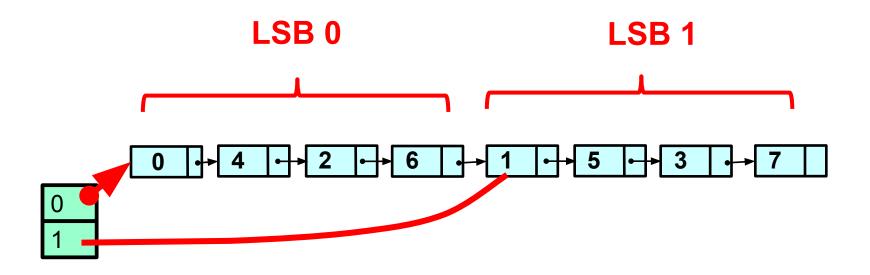

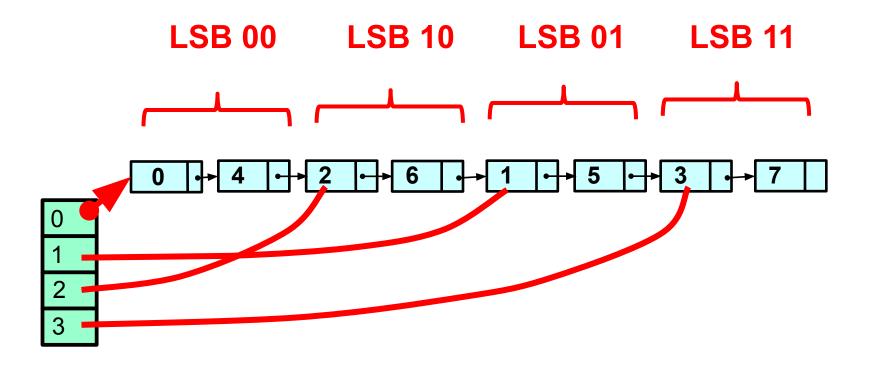

List entries sorted in order that allows recursive splitting. How?

LSB = Least significant Bit

## Split-Order

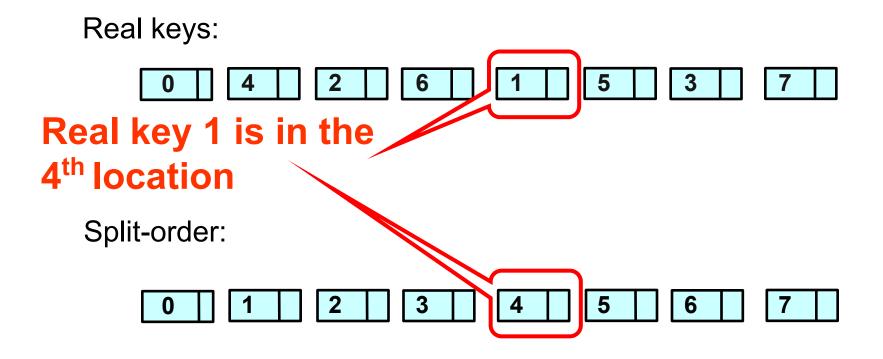

- If the table size is 2<sup>i</sup>,
  - Bucket b contains keys k
    - $k = b \pmod{2^{i}}$
  - bucket index consists of key's i LSBs

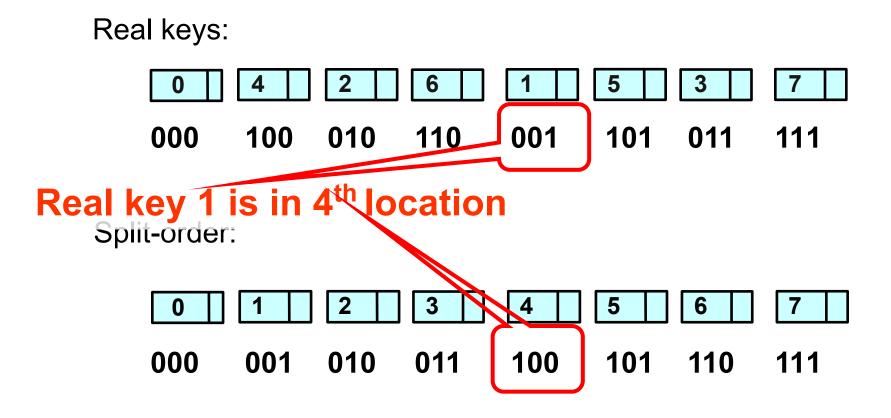

### When Table Splits

- Some keys stay
  - $-b = k \mod(2^{i+1})$
- Some move
  - $-b+2^{i} = k \mod(2^{i+1})$
- Determined by (i+1)<sup>st</sup> bit
  - Counting backwards
- Key must be accessible from both
  - Keys that will move must come later

Real keys:

0 | 4 | 2 | 6 | 1 | 5 | 3 | 7 |

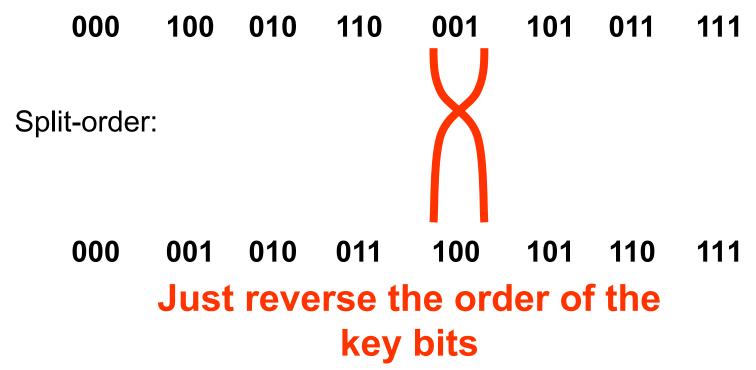

Real keys:

000 100 010 110 001 101 011 111

Split-order:

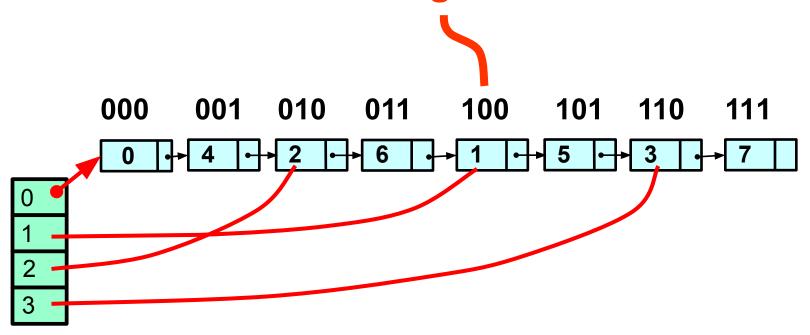

000 001 010 011 100 101 110 111

Real keys:

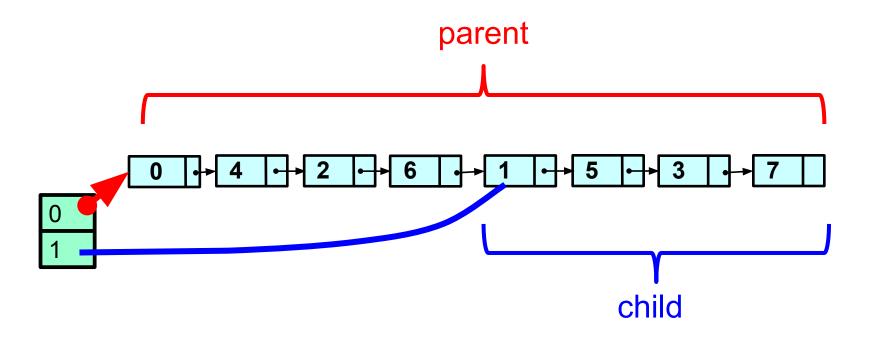

## Split Ordered Hashing

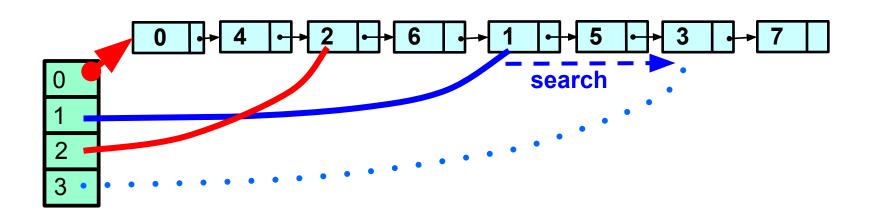

#### Order according to reversed bits

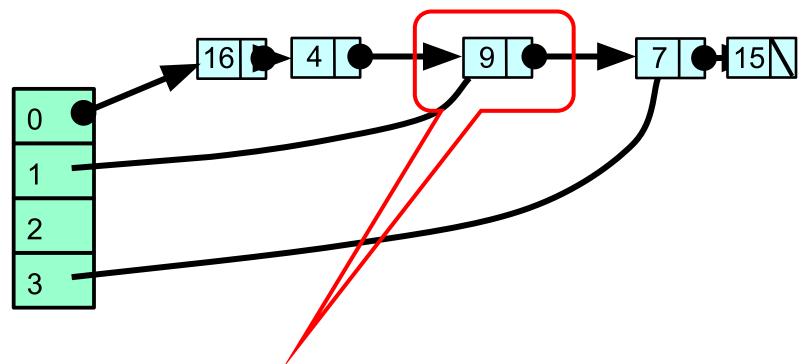

#### **Bucket Relations**

# Parent Always Provides a Short Cut

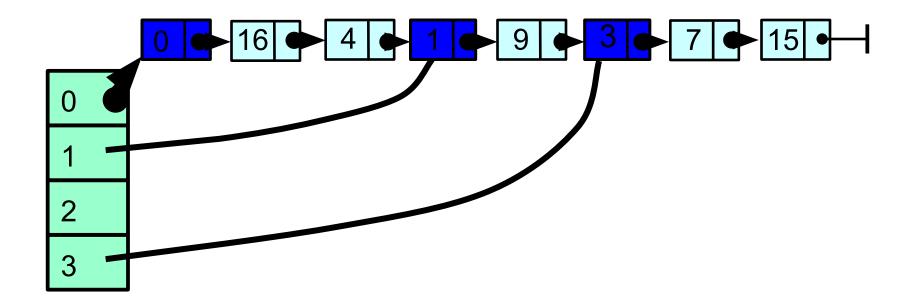

#### Sentinel Nodes

Problem: how to remove a node pointed by 2 sources using CAS

#### **Sentinel Nodes**

Solution: use a Sentinel node for each bucket

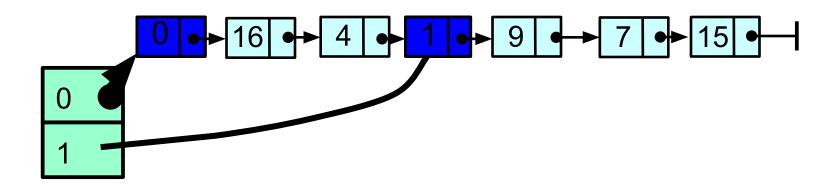

### Sentinel vs Regular Keys

- Want sentinel key for i ordered
  - before all keys that hash to bucket i
  - after all keys that hash to bucket (i-1)

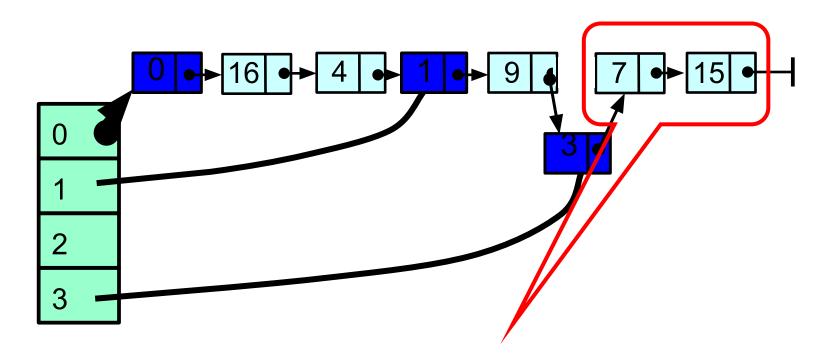

## Splitting a Bucket

- We can now split a bucket
- In a lock-free manner
- Using two CAS() calls ...
  - One to add the sentinel to the list
  - The other to point from the bucket to the sentinel

#### Initialization of Buckets

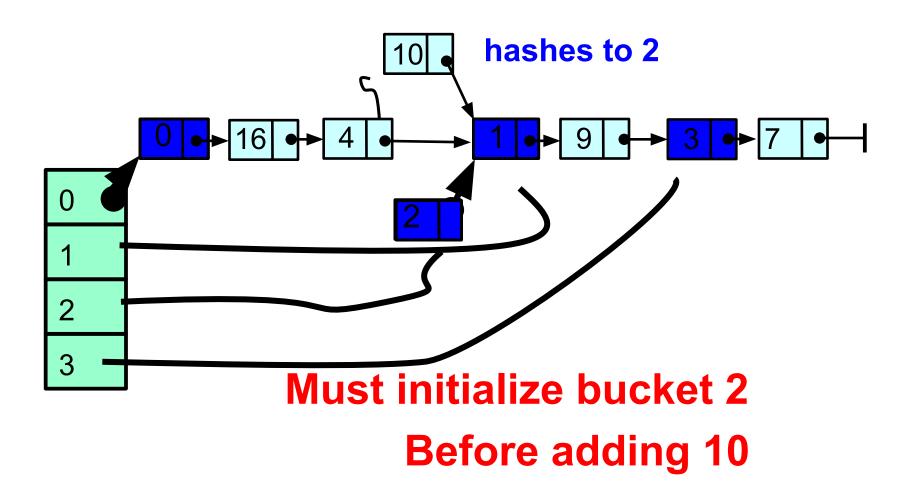

#### Initialization of Buckets

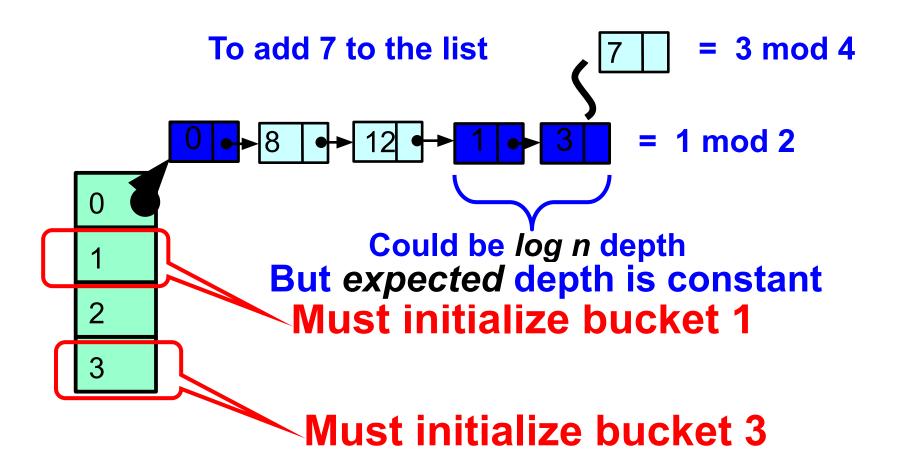

Need to initialize bucket 3 to split bucket 1

### Adding 10

#### Recursive Initialization

#### Lock-Free List

```
int makeRegularKey(int key) {
    return reverse(key | 0x80000000);
}
int makeSentinelKey(int key) {
    return reverse(key);
}
```

#### Lock-Free List

```
int makeRegularKey(int key) {
   return reverse(key | 0x80000000);
}
int makeSentinelKey(int key) {
   return reverse(key)
}
```

## Regular key: set high-order bit to 1 and reverse

#### Lock-Free List

```
int makeRegularKey(int key) {
    return reverse(key | 0x80000000);
}
int makeSentinelKey(int key) {
    return reverse(key);
}
```

Sentinel key: simply reverse (high-order bit is 0)

#### Main List

- Lock-Free List from earlier class
- With some minor variations

# Inserts sentinel with key if not already present ...

# ... returns new list starting with sentinel (shares with parent)

## Split-Ordered Set: Fields

```
public class SOSet {
  protected LockFreeList[] table;
  protected AtomicInteger tableSize;
  protected AtomicInteger setSize;
  public SOSet(int capacity) {
    table = new LockFreeList[capacity];
    table[0] = new LockFreeList();
    tableSize = new AtomicInteger(2);
    setSize = new AtomicInteger(0);
```

```
c class SOSet
protected LockFreeList[] table;
protected AtomicInteger tableSize;
protected AtomicInteger setSize;
public SOSet(int caracity) {
  table = new LockFreeList[capacity];
  table[0] = new LockFreeList();
  ta For simplicity treat table as big
  se
                  array ...
```

```
protected LockFreeList[] table;
 rotected AtomicIn teger tableSize;
protected AtomicInteger setSize;
public SOSet(int capacity) {
  table = new LockFreeList[capacity];
  table[0] = new LockFreeList();
  ta In practice, want something that
  se
            grows dynamically
```

```
public class SOSet {
  protected LockFreeList[] table;
 protected AtomicInteger tableSize;
            AtomicIntqger setSize
 public SOSet(int capaciz
    table = new LockFreeList[capacity];
    table[0] = new LockFreeList();
    ta How much of table array are we
    se
               actually using?
```

```
public class SOSet {
  protected LockFreeList[] table;
  protected AtomicInteger tableSize;
 protected AtomicInteger setSize;
  public SSSet(int capacity) {
    table = new LockFreeList[capacity];
              new LockFreeList();
                Track set size
         so we know when to resize
```

```
Initially use single bucket,
     and size is zero
                               ize;
 protected AtomicInteger setSize;
 public SOSet(int capacity) {
   table = new LockFreeList[capacity];
   table[0] = new LockFreeList();
   tableSize = new AtomicInteger(1);
   setSize = new AtomicInteger(0);
```

```
public boolean add(Object object) {
 int hash = object.hashCode();
 int bucket = hash % tableSize.get();
 int key = makeRegularKey(hash);
 LockFreeList list
   = getBucketList(bucket);
 if (!list.add(object, key))
      return false;
  resizeCheck();
  return true;
```

```
public boolean add(Object object)
int hash = object.hashCode();
int bucket = hash % tableSize.get();
 int key = makeRegularRey(hash)
 LockFreeList list
   = getBucketList(bucket);
if (!list.add(object, key)
      return false;
  resizeCheck();
  return true;
                      Pick a bucket
```

```
public boolean add(Object object) {
 int hash = object.hashCode();
 int bucket = hash % tableSize.get();
int key = makeRegularKey(hash);
   = getBucketList(bucket);
 if (!list.add(object,
      return false;
  resizeCheck();
  return true;
                     Non-Sentinel
                   split-ordered key
```

```
public boolean add(Object object) {
 int hash = object.hashCode();
 int bucket = hash % tableSize.get();
 int key = makeRegularKey(hash);
 LockFreeList list
   = getBucketList(bucket);
      return false;
  rosizoChook():
       Get reference to bucket's
    sentinel, initializing if necessary
```

```
Call bucket's add() method with
          reversed key
int key = makeRegularKey(hash);
LockFreeList list
  = getBucketList(b
if (!list.add(object, key)
 resizeCheck();
 return true;
```

```
No change? We're done.
int bucket = hash % tableSize.get();
int key = makeRegularKey(hash);
LockFreeList list
 = getBucketList(bucket);
if (!list.add(object, key))
     return false;
 resizeCheck
 return true;
```

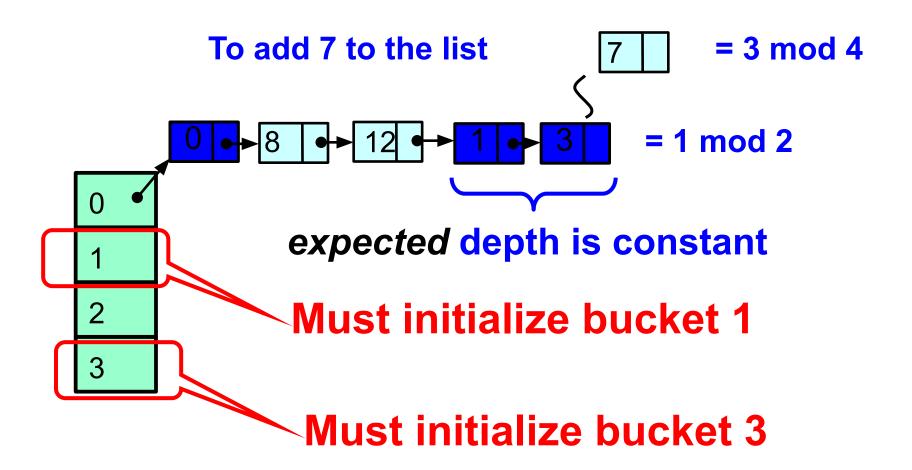

```
Time to resize?
int bucket = has % tableSize.get();
int key = makePegularKey(hash);
LockFreeList ]
  = getBucketList(bucket);
if (!list.add(object, key))
     return false;
 resizeCheck();
 return true;
```

#### Resize

- Divide set size by total number of buckets
- If quotient exceeds threshold
  - Double tableSize field
  - Up to fixed limit

- Buckets originally null
- If you find one, initialize it
- Go to bucket's parent
  - Earlier nearby bucket
  - Recursively initialize if necessary
- Constant expected work

#### Recall: Recursive Initialization

```
<u>initializeBucket(int bucket</u>
int parent = getParent(bucket);
if (table[parent] == null)
 initializeBucket(parent);
int key = makeSentinelKey(bucket);
LockFreeList list =
  new LockFreeList(table[parent],
              Find parent, recursively
                 initialize if needed
```

#### 

#### Correctness

- Linearizable concurrent set
- Theorem: O(1) expected time
  - No more than O(1) items expected between two sentinels on average
  - Lazy initialization causes at most O(1) expected recursion depth in initializeBucket()
  - Can eliminate use of sentinels

# Closed (Chained) Hashing

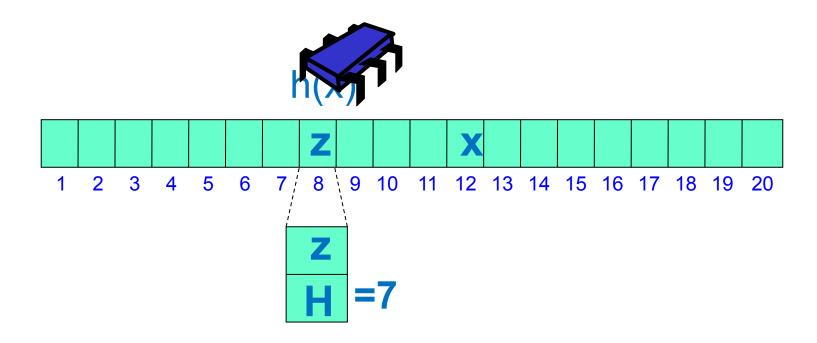

- Advantages:
  - with N buckets, M items, Uniform h
  - retains good performance as table density
     (M/N) increases 
     less resizing
- Disadvantages:
  - dynamic memory allocation
  - bad cache behavior (no locality)

Oh, did we mention that cache behavior matters on a multicore?

## Open Addressed Hashing

- Keep all items in an array
- One per bucket
- If you have collisions, find an empty bucket and use it
- Must know how to find items if they are outside their bucket

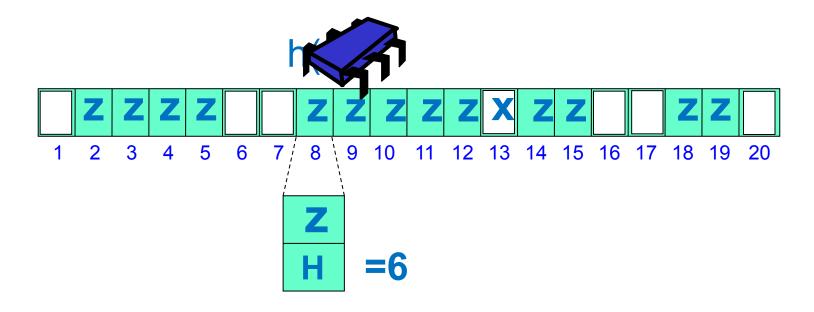

# Linear Probing\*

contains (x) – search linearly from h(x) to h(x) + H recorded in bucket.

\*Attributed to Amdahl...

## **Linear Probing**

add(x) – put in first empty bucket, and update H.

## **Linear Probing**

- Open address means M ≪ N
- Expected items in bucket same as Chaining
- Expected distance till open slot:

$$\frac{1}{2}\left(1+\left(\frac{1}{1-M/N}\right)^2\right)$$

M/N = 0.5  $\square$  search 2.5 buckets

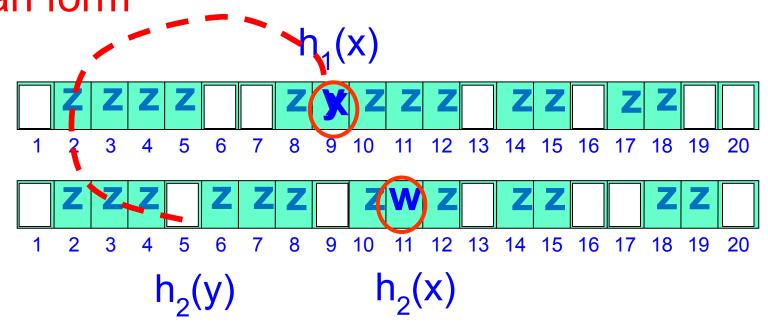

M/N = 0.9  $\square$  search 50 buckets

## **Linear Probing**

- Advantages:
- Disadvantages:
  - As M/N increases more cache misses
    - searching 10s of unrelated buckets
    - "Clustering" of keys into neighboring buckets
  - As computation proceeds "Contamination" by deleted items 

     more cache misses

But cycles Cuckoo Hashing can form

add (x) – if  $h_1(x)$  and  $h_2(x)$  full evict y and move it to  $h_2(y) \neq h_2(x)$ . Then place x in its place.

## Cuckoo Hashing

- Advantages:
  - -contains (x): deterministic 2 buckets
  - No clustering or contamination
- Disadvantages:
  - 2 tables
  - h<sub>i</sub>(x) are complex
  - As M/N increases □ relocation cycles
  - Above M/N = 0.5 Add() does not work!

### Concurrent Cuckoo Hashing

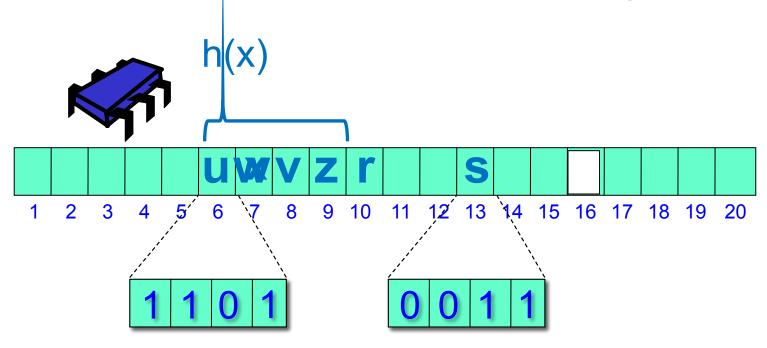

- Need to either lock whole chain of displacements (see book)
- or have extra space to keep items as they are displaced step by step.

## Hopscotch Hashing

- Single Array, Simple hash function
- Idea: define neighborhood of original bucket
- In neighborhood items found quickly
- Use sequences of displacements to move items into their neighborhood

## Hopscotch Hashing 3 11 12 13 14 15 16 17 18 19 10 H=4

contains (x) – search in at most H buckets (the hop-range) based on hop-info bitmap. In practice pick H to be 32.

add (x) – probe linearly to find open slot. Move the empty slot via sequence of displacements into the *hop-range* of h(x).

- contains
  - wait-free, just look in neighborhood

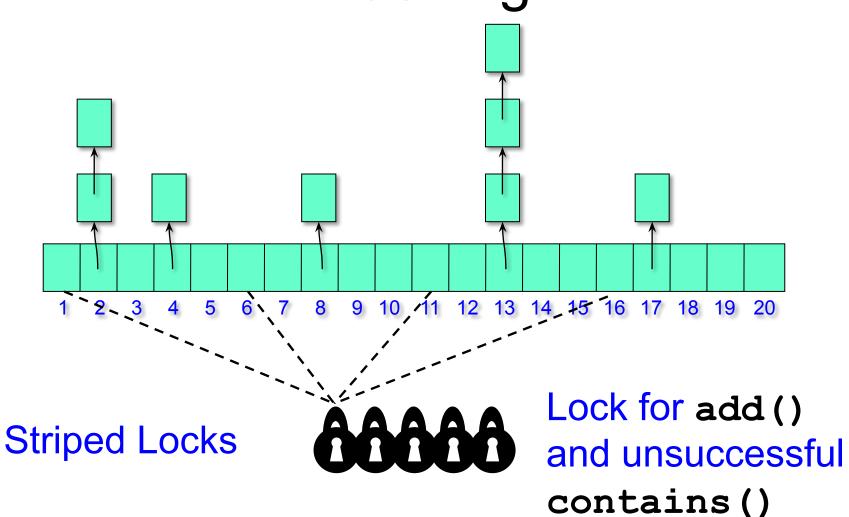

- contains
  - wait-free, just look in neighborhood
- add
  - expected distance same as in linear probing

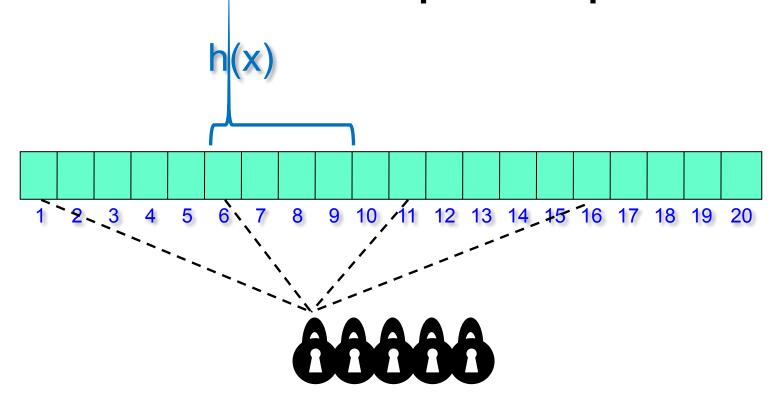

- contains
  - wait-free, just look in neighborhood
- add
  - Expected distance same as in linear probing
- resize
  - neighborhood full less likely as H □ log n
  - one word hop-info bitmap, or use smaller H and default to linear probing of bucket

#### Advantages

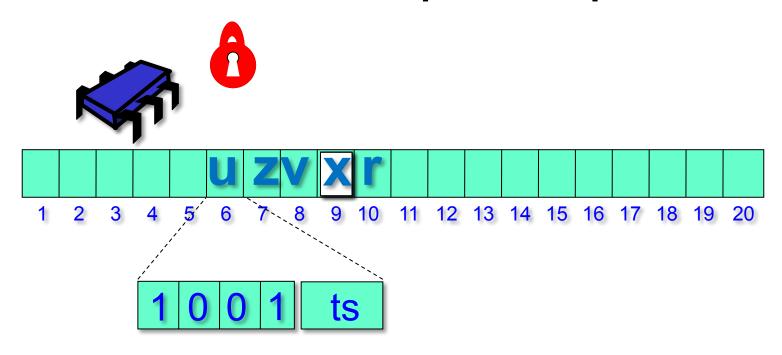

- Good locality and cache behavior
- As table density (M/N) increases
   less resizing
- Move cost to add() from contains(x)
- Easy to parallelize

# Recall: Concurrent Chained Hashing

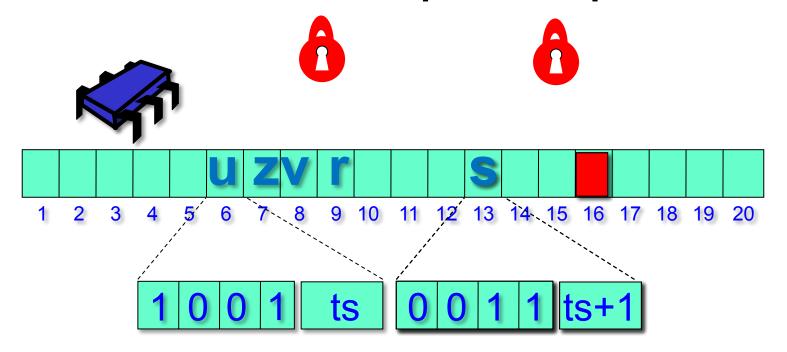

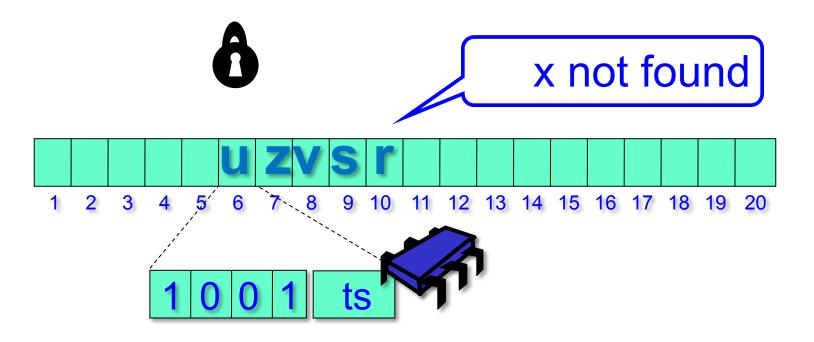

contains () is wait-free

add(x) - lock bucket, mark empty
slot using CAS, add x erasing mark

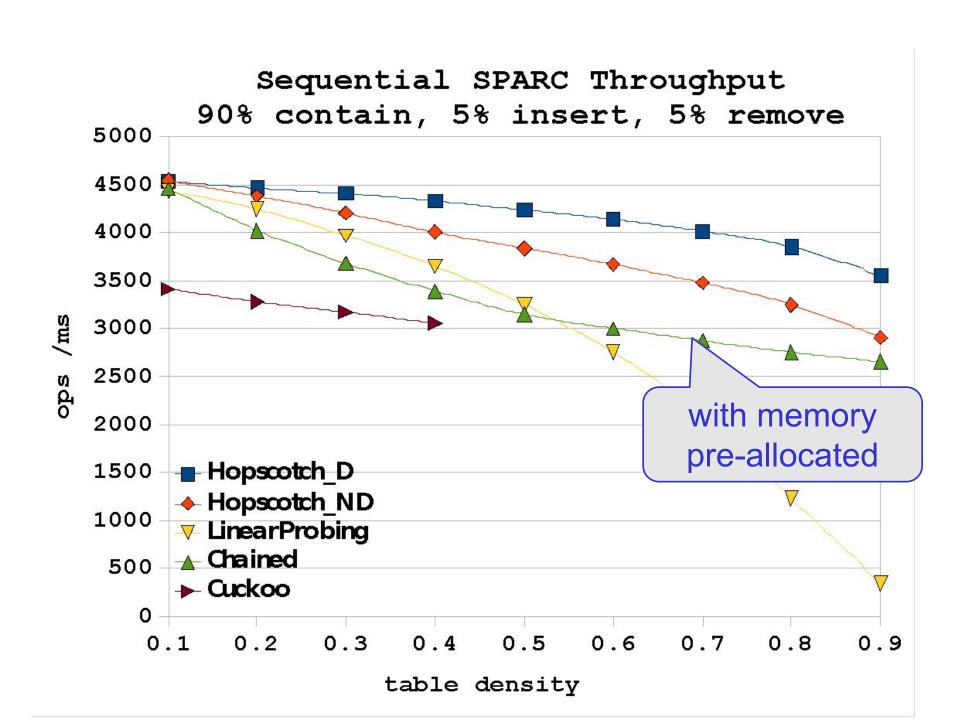

add (x) – lock bucket, mark empty slot using CAS, lock bucket and update timestamp of bucket being displaced before erasing old value

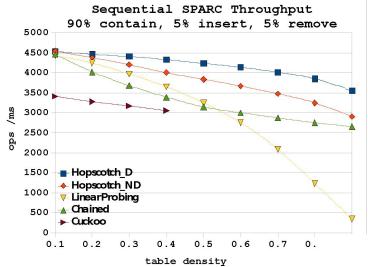

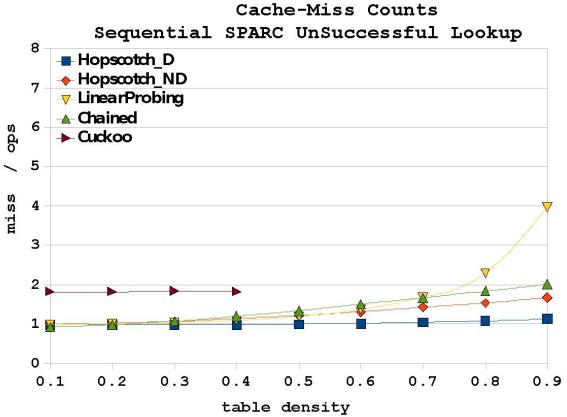

Contains (x) – traverse using bitmap and if ts has not changed after traversal item not found. If ts changed, after a few tries traverse through all items.

# Is performance dominated by cache behavior?

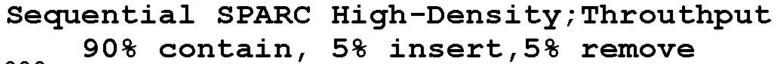

- Test on multicores and uniprocessors:
  - Sun 64 way Niagara II, and
  - Intel 3GHz Xeon
- Benchmarks pre-allocated memory to eliminate effects of memory management

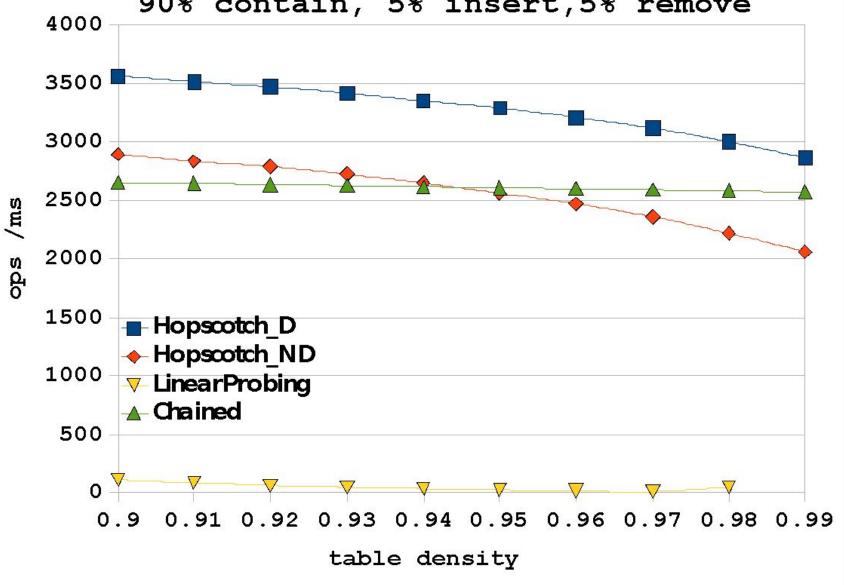

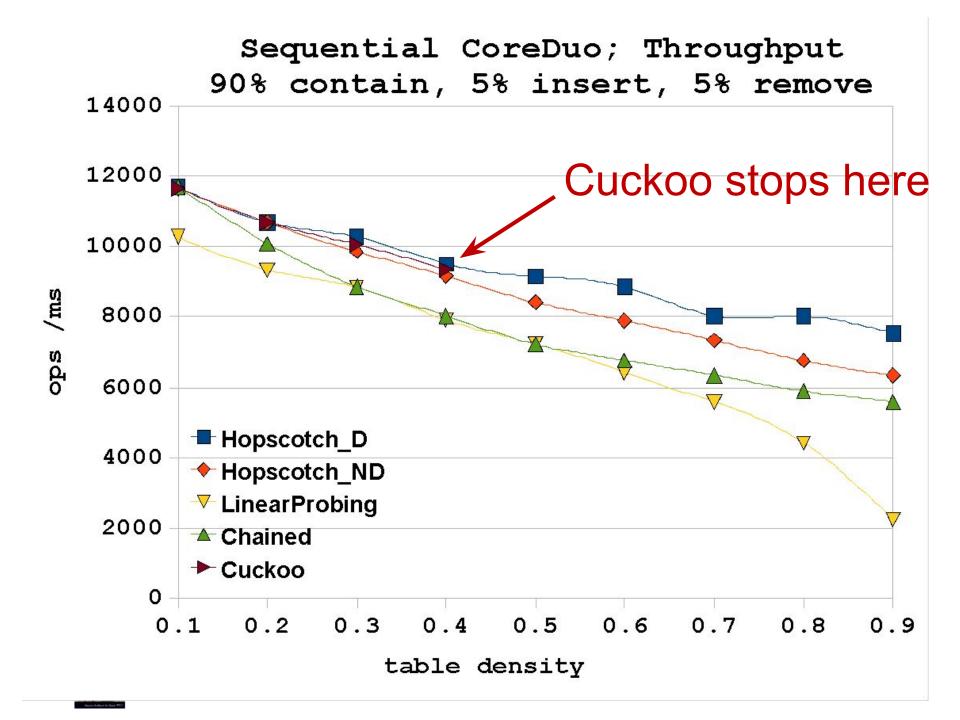

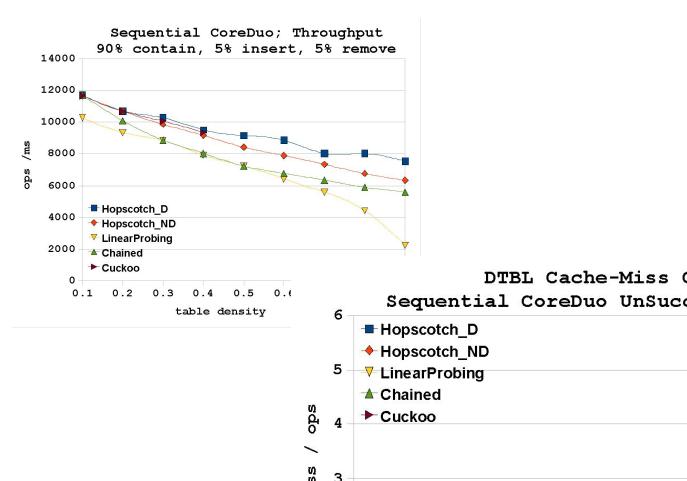

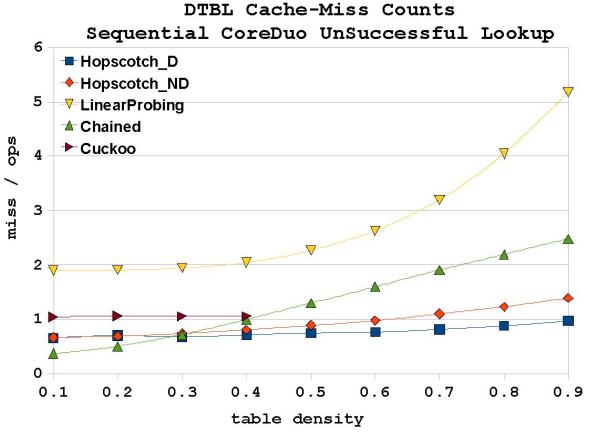

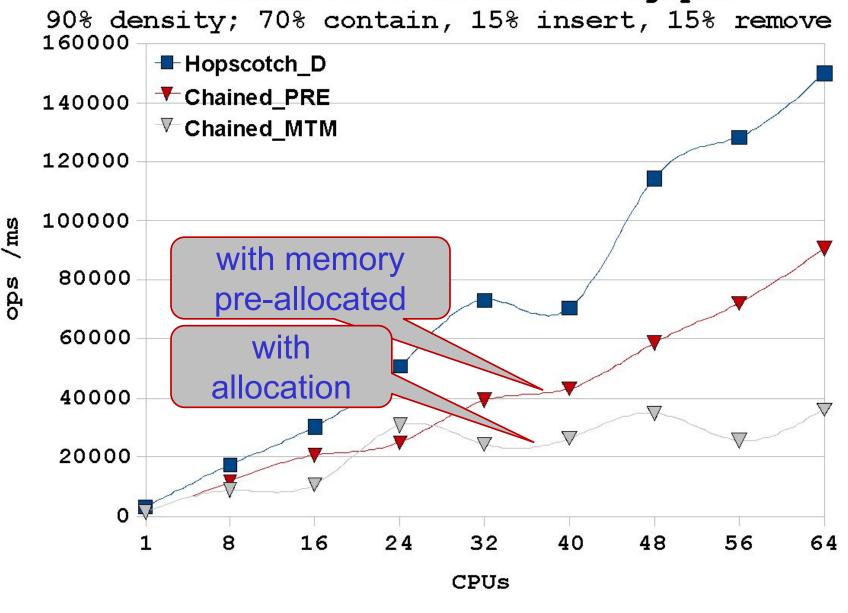

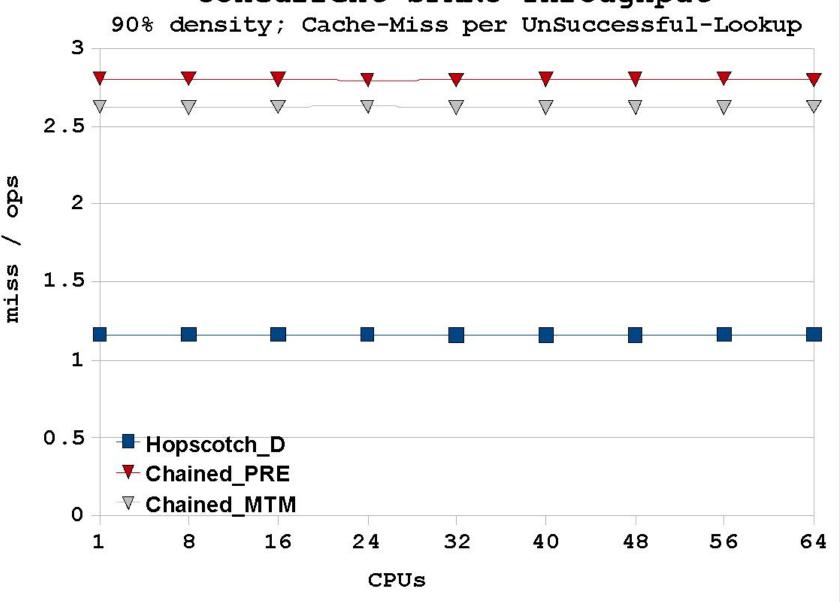

#### Concurrent SPARC Throughput

#### Concurrent SPARC Throughput

#### Summary

- Chained hash with striped locking is simple and effective in many cases
- Hopscotch with striped locking great cache behavior
- If incremental resizing needed go for split-ordered
